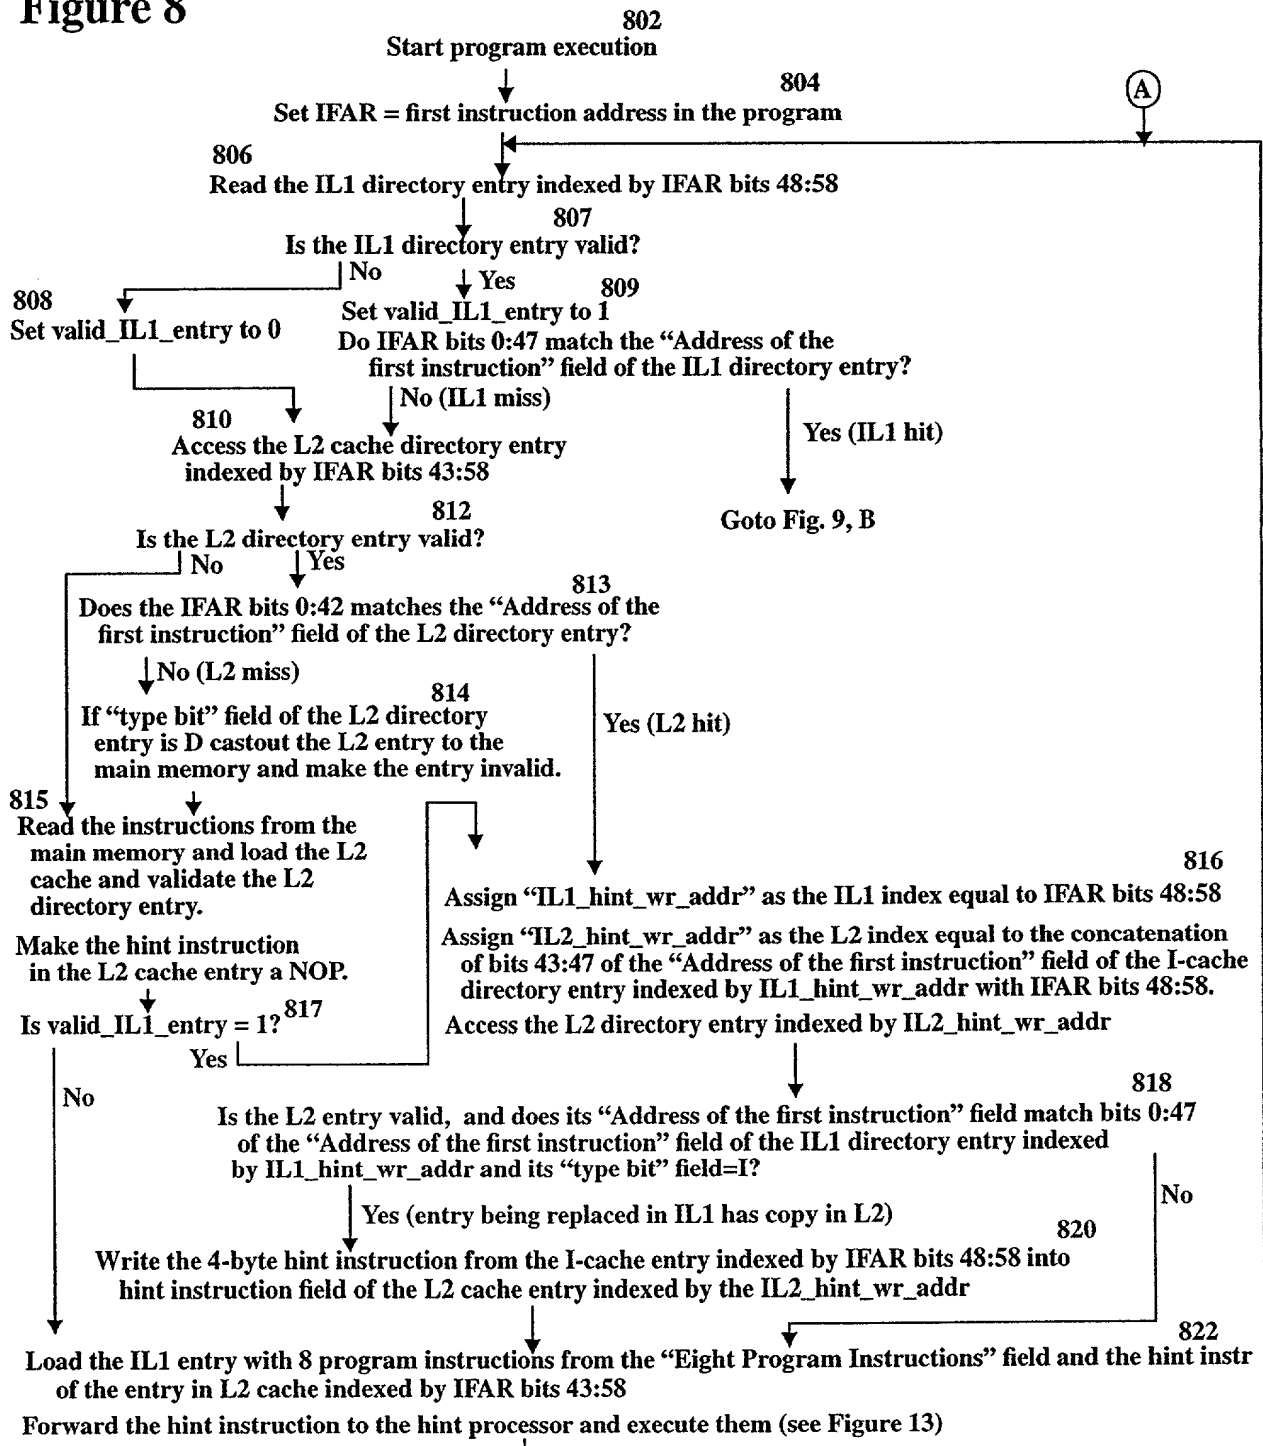

Figure 9

(B) From Figure 8.

901 Fetch the IL1 cache line into "Eight Program Instructions" register, and the associated hint instructions in the Hint Instruction register.

Access the BHT entry indexed by the IFAR bits 48:58, and fetch its BHT prediction bits into the "Eight Predictions" register.

903 Use the IFAR bits 59:61 to locate "first instruction" in the "Eight Program Instructions" register. (Instructions before the "first instruction", if any, will be ignored).

904 Is there any branch instruction in the "Eight Program Instructions" register at or after the "first instruction"?

Yes
Designate a "fetch group" as the instructions from the "first instruction" to the end of the register. Set "Predicted_IFAR" to the address of the next sequential instruction after the "fetch group".

907

In the hint processor, fill the BHT Hint register with the following: bits 0:4 with "ld_bht_op", bits 5:15 with IFAR bits 48:58, bits 16:23 with a 8-bit "branch mask" field containing a 1 in the positions where there is a branch and 0 in other positions, bits 24:31 with the 8-bit BHT prediction.

In the hint processor, store IFAR bits 48:58 in the BHT Hint Write Entry register

Store the content of the BHT Hint register in the Hint Instruction field in the IL1 Cache at the location in the BHT Hint Write Entry register

911 Is any branch indicated in the "Eight Predictions" register to be an unconditional branch or a conditional branch predicted taken?

Yes
912 Set "Predicted_IFAR" to the target of the first of these branches and designates this branch as the "last instruction".

No
914 Set "Predicted_IFAR" to the address of the instruction next sequential to the last instruction fetched. Designate the last instruction in the "Eight Instructions" register as the "last instruction".

921 All instructions between the "first instruction" and the "last instruction" forms the "fetch group".

For each branch in fetch group, obtain an invalid entry in the Branch Information Queue (BIQ), set its valid bit to 1 state and put:

the address of the branch in the "Address of the branch" field,
the branch target address in the "Predicted address" field if the branch is predicted taken or the sequential address in the "Predicted address" field if the branch is predicted not-taken,
if the branch is at position "n", store the n-th bit in the "Eight Predictions" register in the "BHT bit" field.

Place the branch in the branch issue queue for its subsequent execution.

926

Forward the fetch group to Instruction Decode Unit (IDU), see Figure 11.
